

AppCurity's Managed Services

A scalable, cost-effective model helps you maintain a proactive security posture

At AppCurity, we believe that our security-as-a-service model provides organizations of all sizes and markets the flexibility, scalability and cost effectiveness to secure the applications that power your business.

On-demand testing

AppCurity's on-demand, cloud-based platform provides you a portal to easily schedule tests and change the schedule or depth of any test. This empowers you to address changing business requirements, adapt to agile development cycles, and respond to evolving threats. You can readily access results, associated remediation guidance and aggregate data about broader testing activity.

Flexibility

AppCurity provides the deepest roster of available testing, extending managed service to common requirements such as mobile testing, network penetration testing and source code review. Testing is further delineated by test depth, empowering your organization to match test depth with the risk profile of each application.

Elastic capacity

Organizations that test in-house are immediately constrained by the staff capacity. But factors such as the testing demands of agile development cycles conspire to create uneven, non-linear demand. AppCurity's managed services approach provides your organization access to the testing capacity it needs, when it needs it.

Higher fidelity

Practice makes proficient. AppCurity runs thousands of tests a year and assimilates the experience and expertise gained from these tests into our managed services. Our clients tell us that they get testing of much higher fidelity from AppCurity—even when they use the same set of testing tools we employ.

Access to security experts

AppCurity's managed services approach provides your organization invaluable access to knowledgeable AppCurity experts. These experts provide critical remediation guidance to your team, empowering them to fix what is found in the testing process.

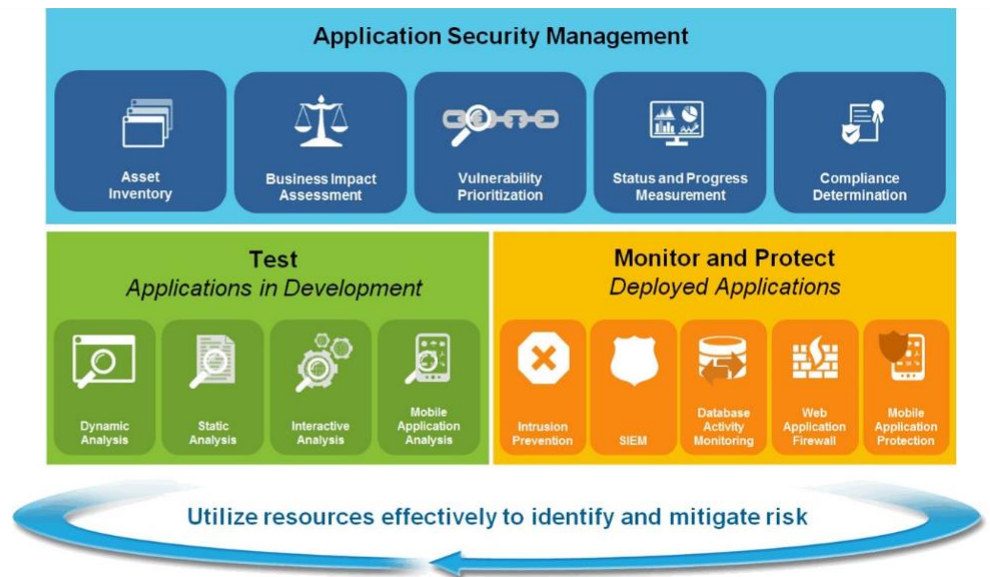

AppCurity services available through our managed services plan

| | |
|---------------------------------|---|
| Web Application Testing | Dynamic scanning, automated and manual ethical hacks to identify and remove security vulnerabilities. All tests can be run against production applications or against a development (QA) environment. |
| Mobile Application Testing | Security scans and custom tests specifically for mobile apps, with expert guidance on how to keep them secure. |
| Application Penetration Testing | The latest dynamic analysis strategies to find flaws lurking in your server-side applications. |
| Network Penetration Testing | Pen tests to identify and remove vulnerabilities in firewalls, routers, operating systems and visible IP services. |
| Security Architecture Survey | Design analysis to address any errors in configuration, authentication controls and access management. |
| Source Code Review | Static analysis with automated and manual techniques to find and fix bugs in pre-production environments. |
| Remediation Help Desk | Direct access to software security experts to help you remove bugs and resolve flaws. |

Easy-to-navigate, always-on portal for a single point of access

Use our AppCurity portal to track work requested and completed, share results between our team and yours, as well as across your internal departments.

- **Schedule tests when You need them.**
- **Manage test depth and schedule.**
- **View and download test results.**
- **Access test history.**
- **Compare application and business unit performance.**

The AppCurity Difference

AppCurity is a leader in application and software security. We go beyond traditional testing services to help organizations find, fix and prevent vulnerabilities in the applications that power their business.
